

# MicroBooNE Signal Waveform Simulation Using Garfield

Bo Yu

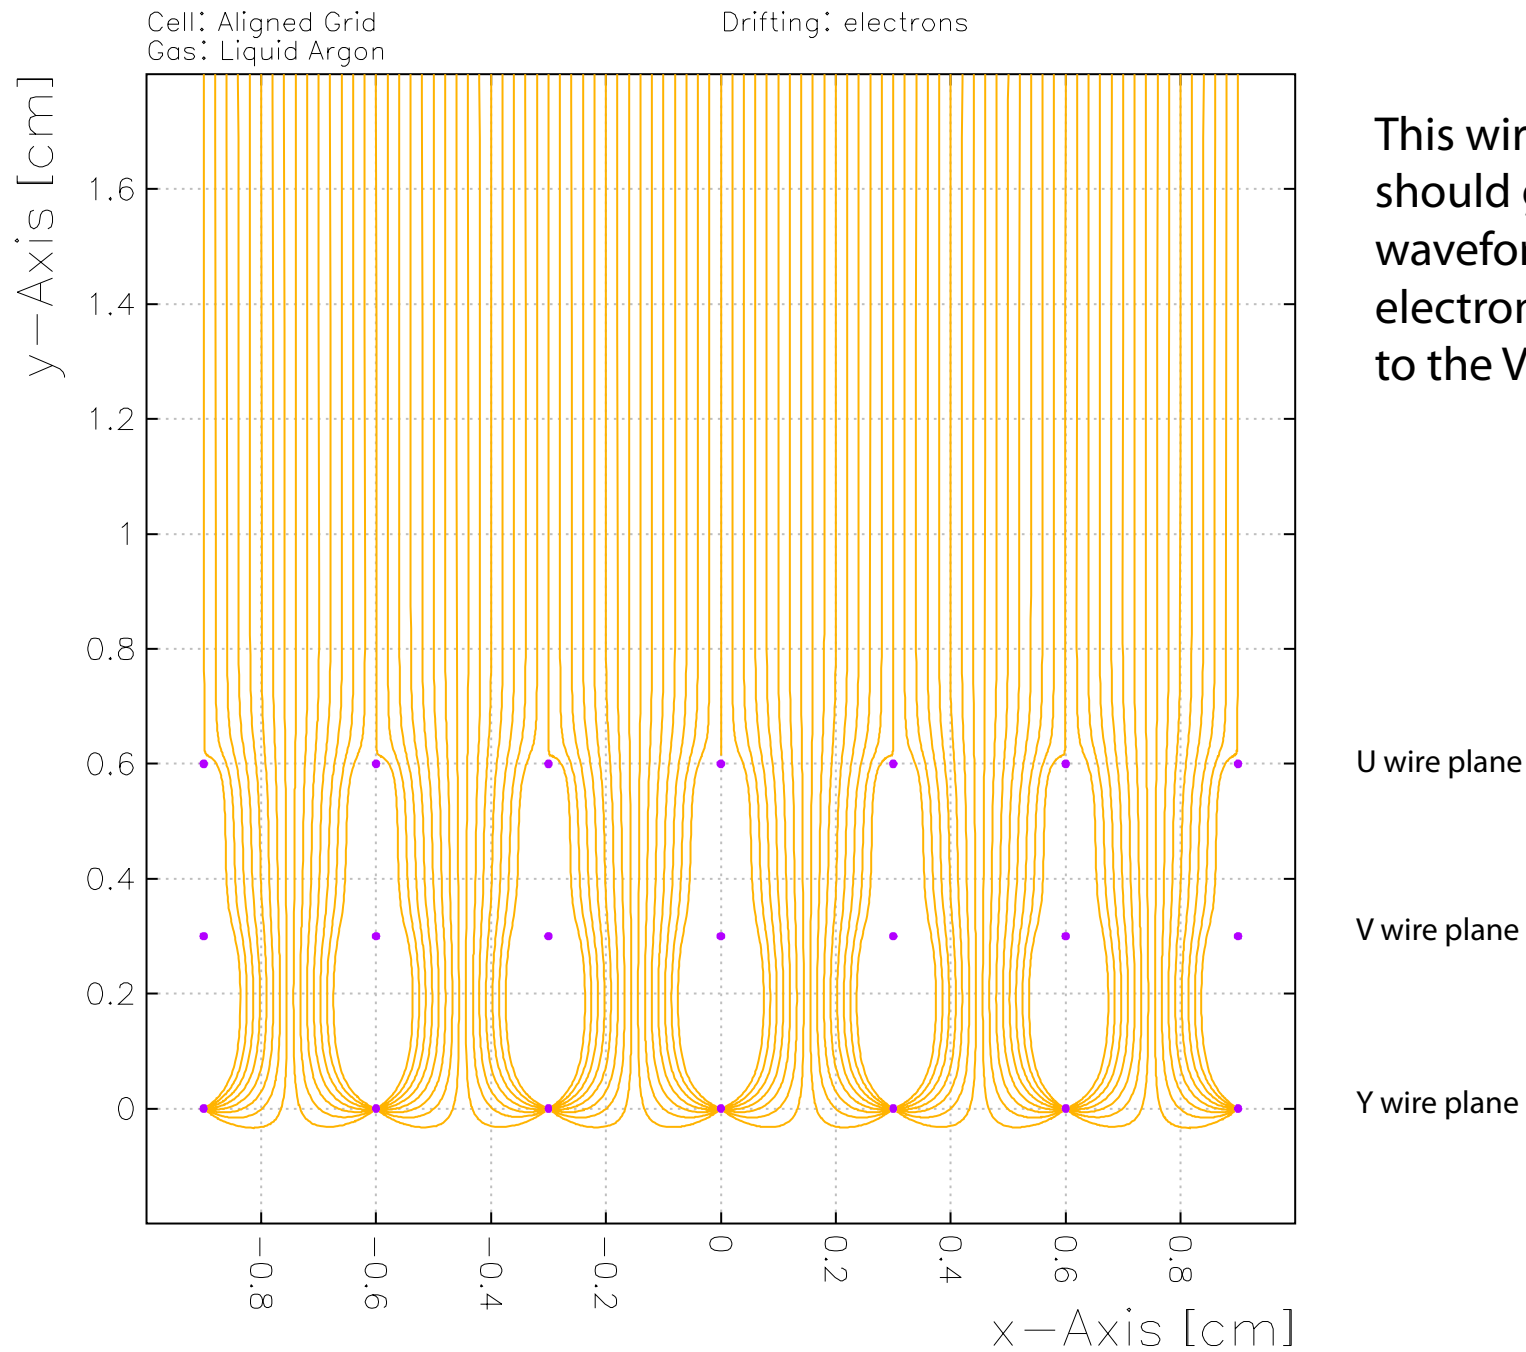

Electronics Working Group Meeting

Jan. 7, 2009

# Limitations

- 2D Field Simulation: all wires are parallel
  - Should not affect the large scale time structure
  - Smaller scale features in the waveform will be different, most likely to be smoothed out in a crossed wire configuration
- Limited drift distance (1000 data points in time) and number of wires
  - Amplitude of the U wire “DC” current is exaggerated.

# Wire Grid Layout and Electron Drift Lines

This wire arrangement should give a smoother waveform because the electrons do not pass close to the V wires.

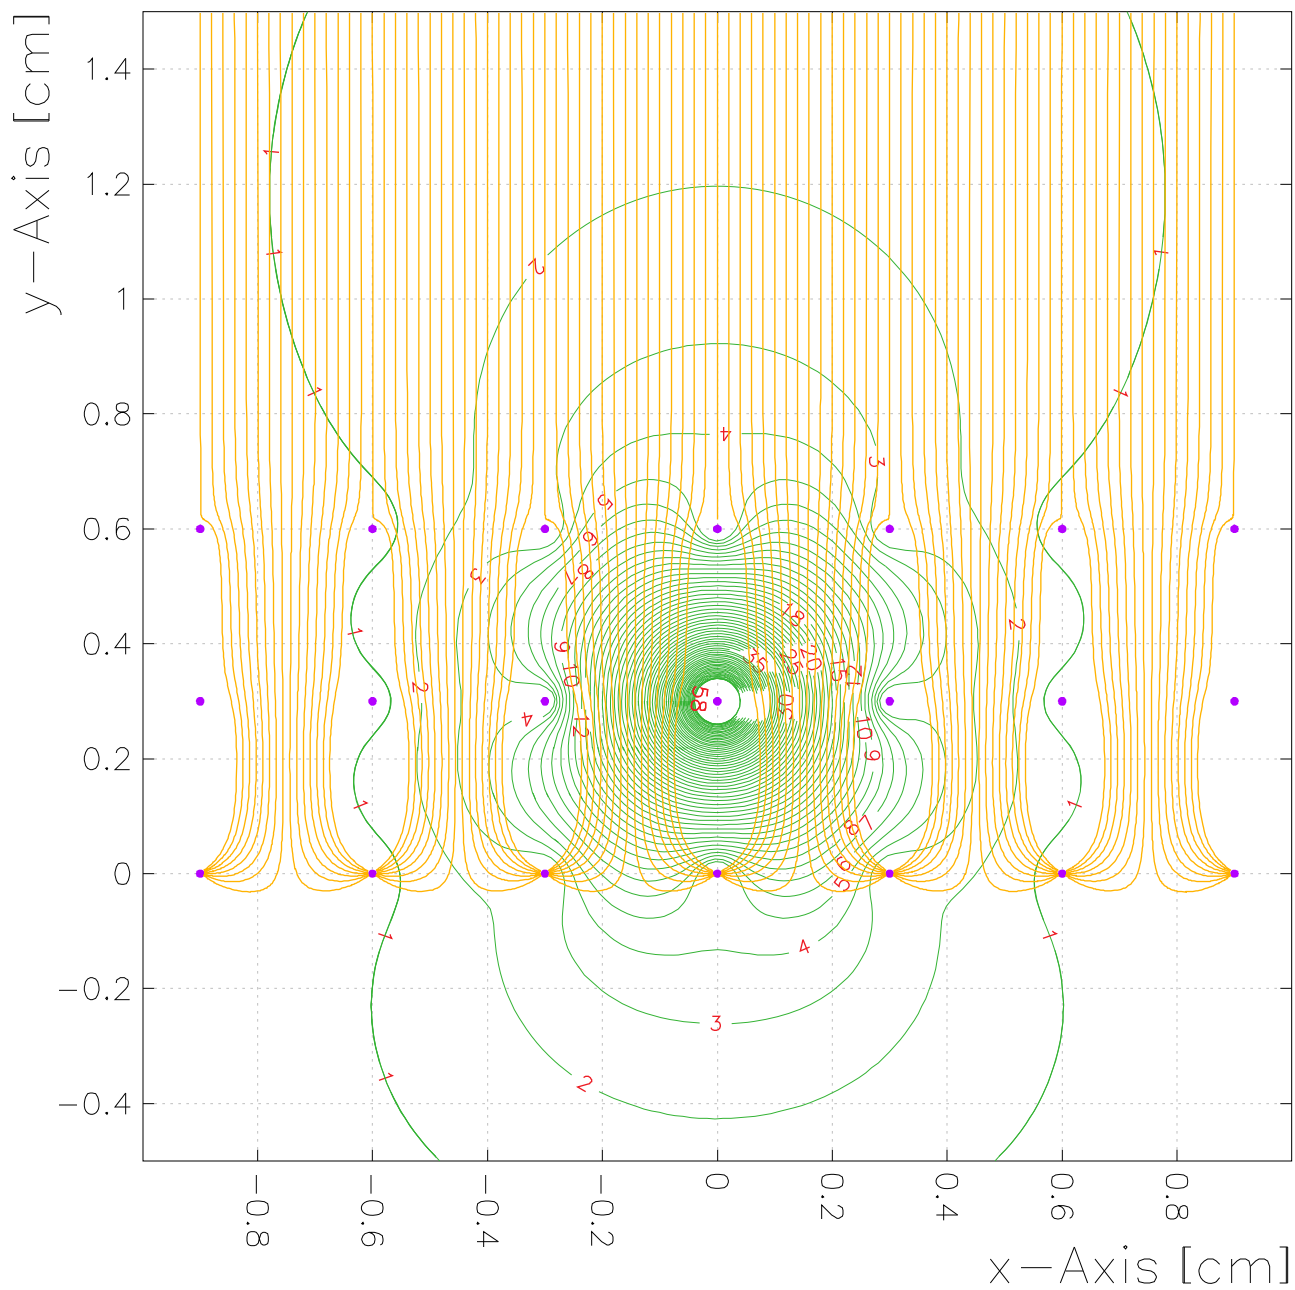

# Weighting Potential Distribution

- The following 3 plots show the weighting potential contours of U, V, Y wire respectively.
- The electron drift lines (orange color) are superimposed on the weighting field contours.
- The induced current on each wire is derived by calculating  $\vec{v}_d \cdot \vec{E}_w$  along the drift line of each electrons.

# Weighting Field of a U Wire

# Weighting Field of a V Wire

# Weighting Field of a Y Wire

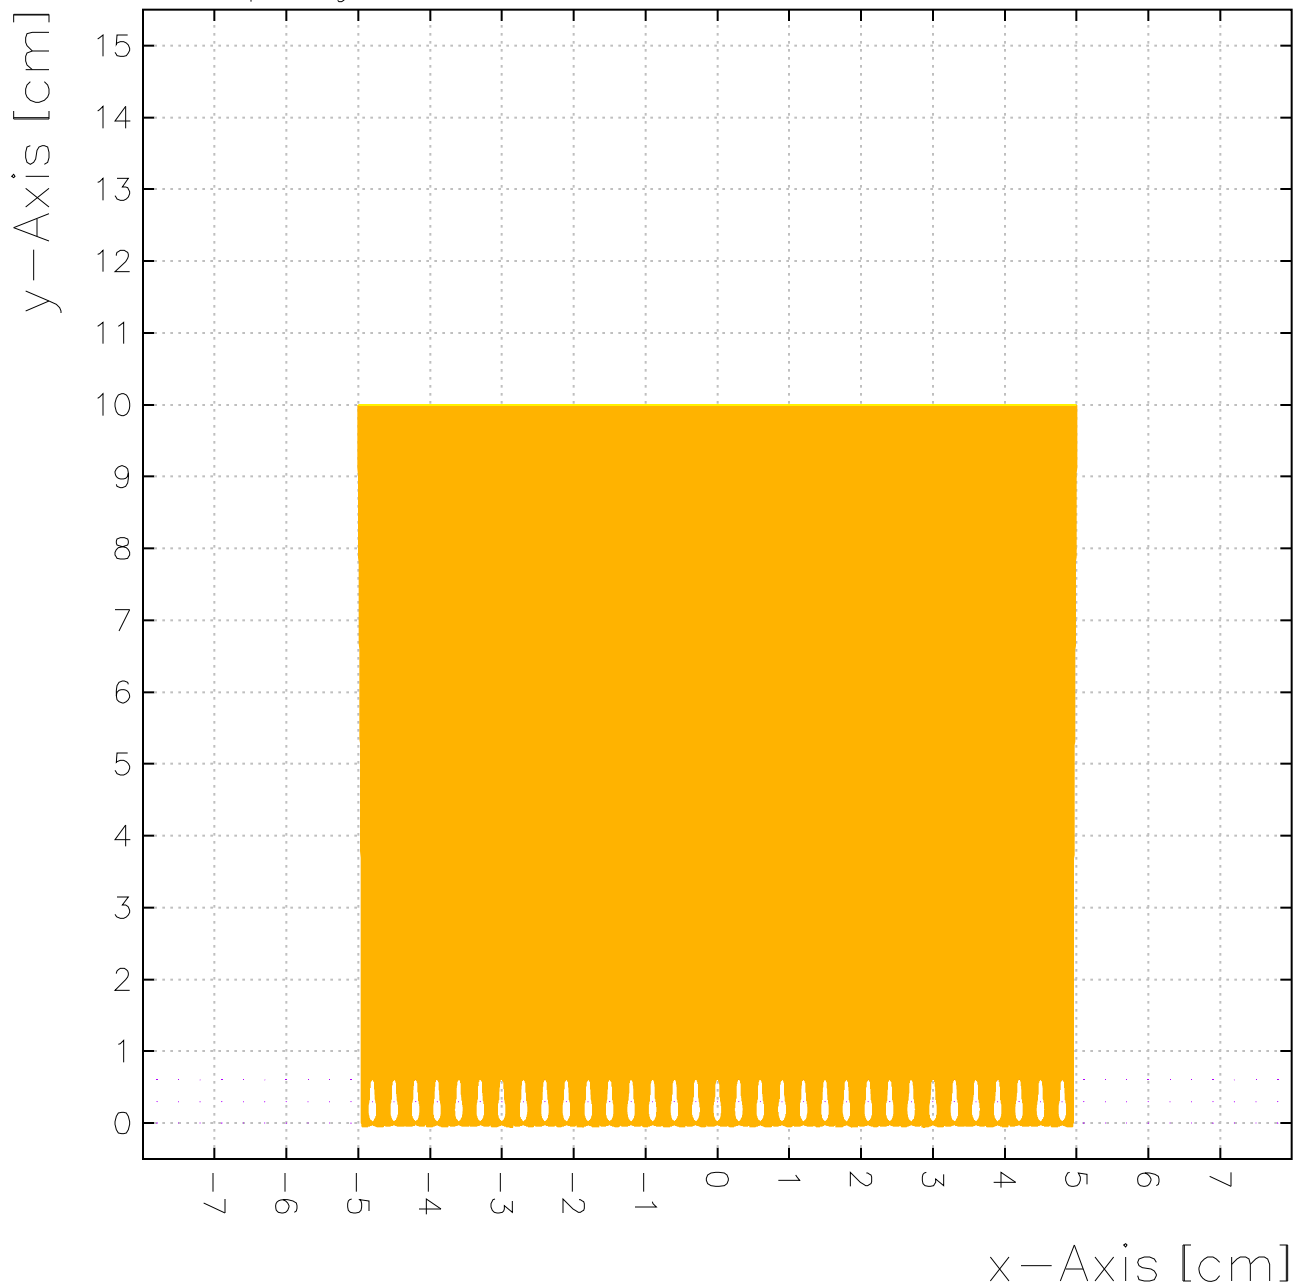

- The following plots show the induced current waveform from the central U, V and Y wire.
- The tracks are 10cm long, with 1000 electrons uniformly distributed. The center of the track segment is fixed at 10cm above the Y wire plane

# Electron drift lines from a track

Cell: 30cmx20cm drift  
Gas: Liquid Argon

Particle: 1000 equally spaced points

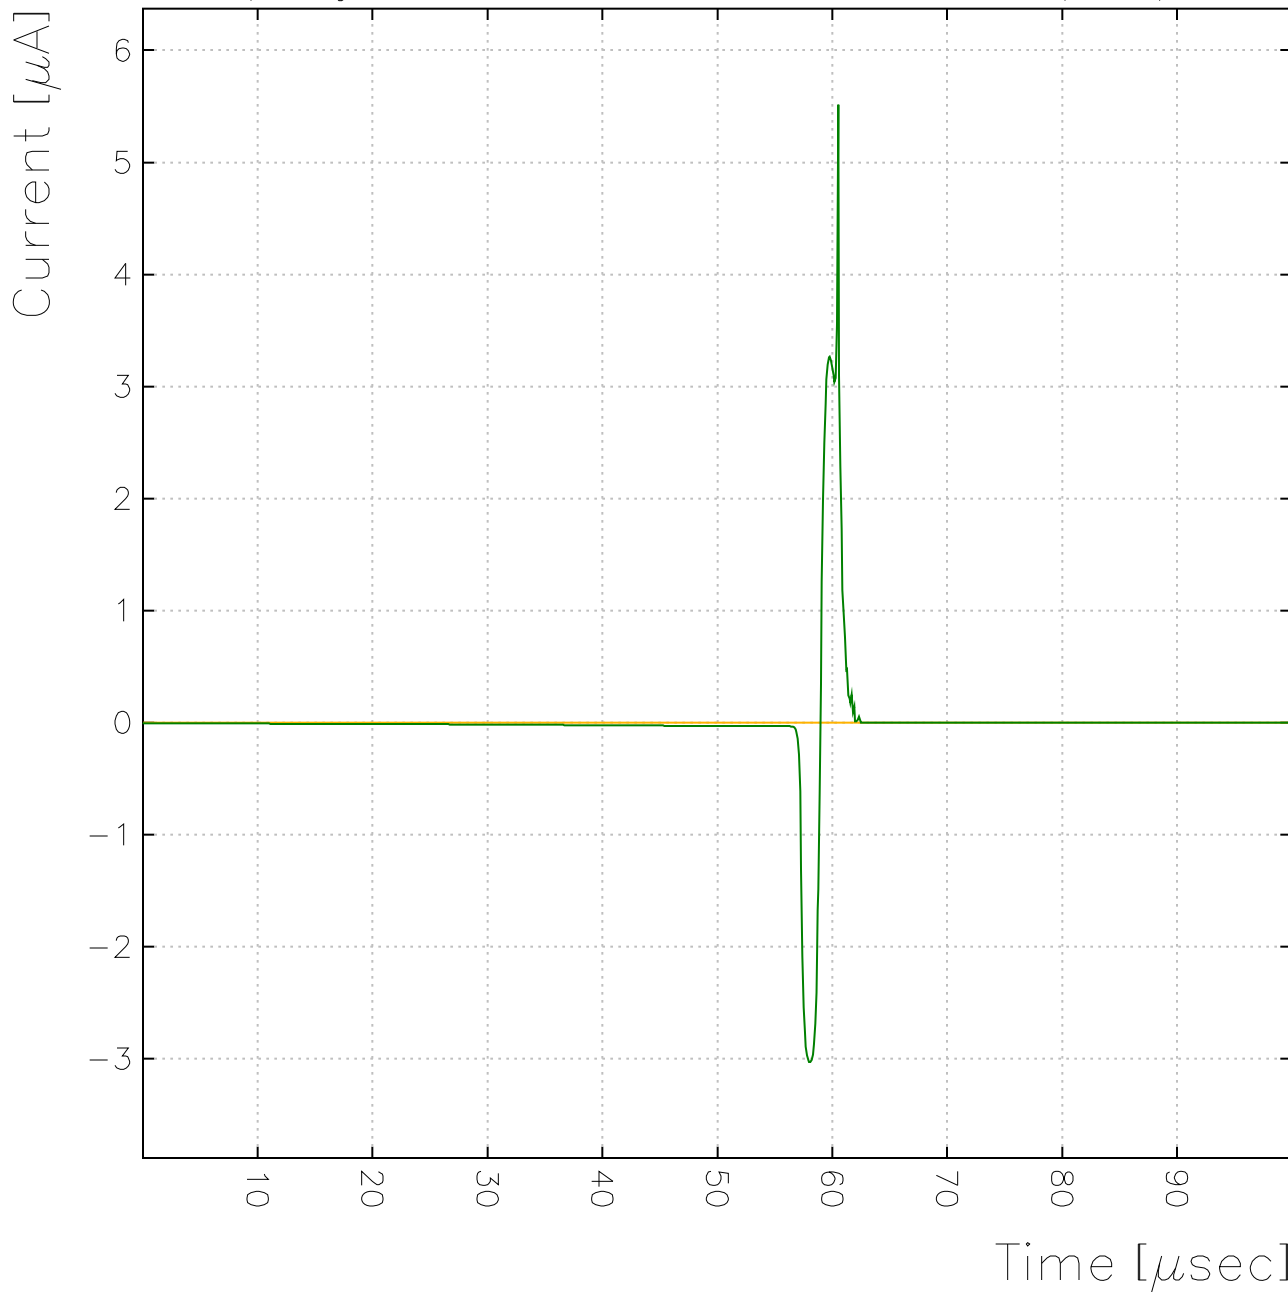

Induced currents on V

Cell: 30cmx20cm drift  
Gas: Liquid Argon

Particle: 1000 equally spaced points  
Ion tail: absent, electron pulse: present

# Electron drift lines from a track

Cell: 30cmx20cm drift  
Gas: Liquid Argon

Particle: 1000 equally spaced points

1.7 degree from vertical

x-Axis [cm]

# Induced currents on U

\* 10<sup>-6</sup>

Cell: 30cmx20cm drift  
Gas: Liquid Argon

Particle: 1000 equally spaced points  
Ion tail: absent, electron pulse: present

Induced currents on V

\*  $10^{-6}$

Cell: 30cmx20cm drift  
Gas: Liquid Argon

Particle: 1000 equally spaced points  
Ion tail: absent, electron pulse: present

# Electron drift lines from a track

Cell: 30cmx20cm drift  
Gas: Liquid Argon

Particle: 1000 equally spaced points

45 degree from vertical

x-Axis [cm]

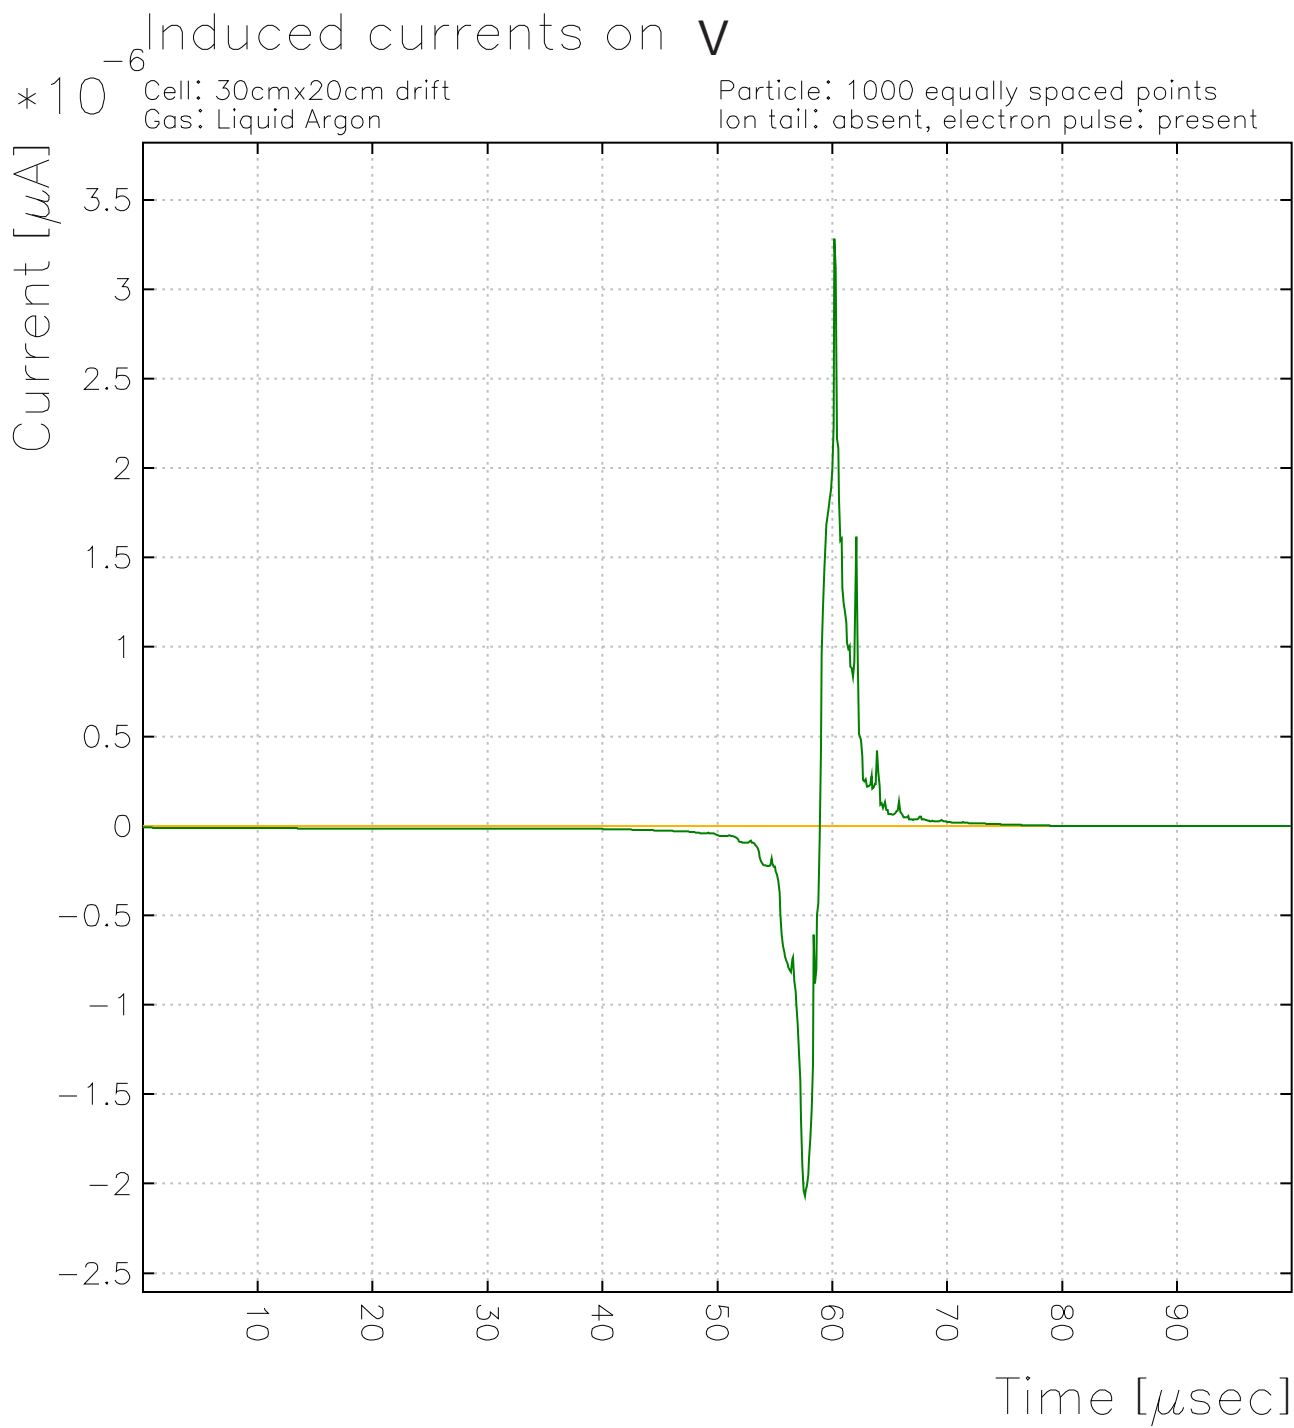

# Induced currents on U

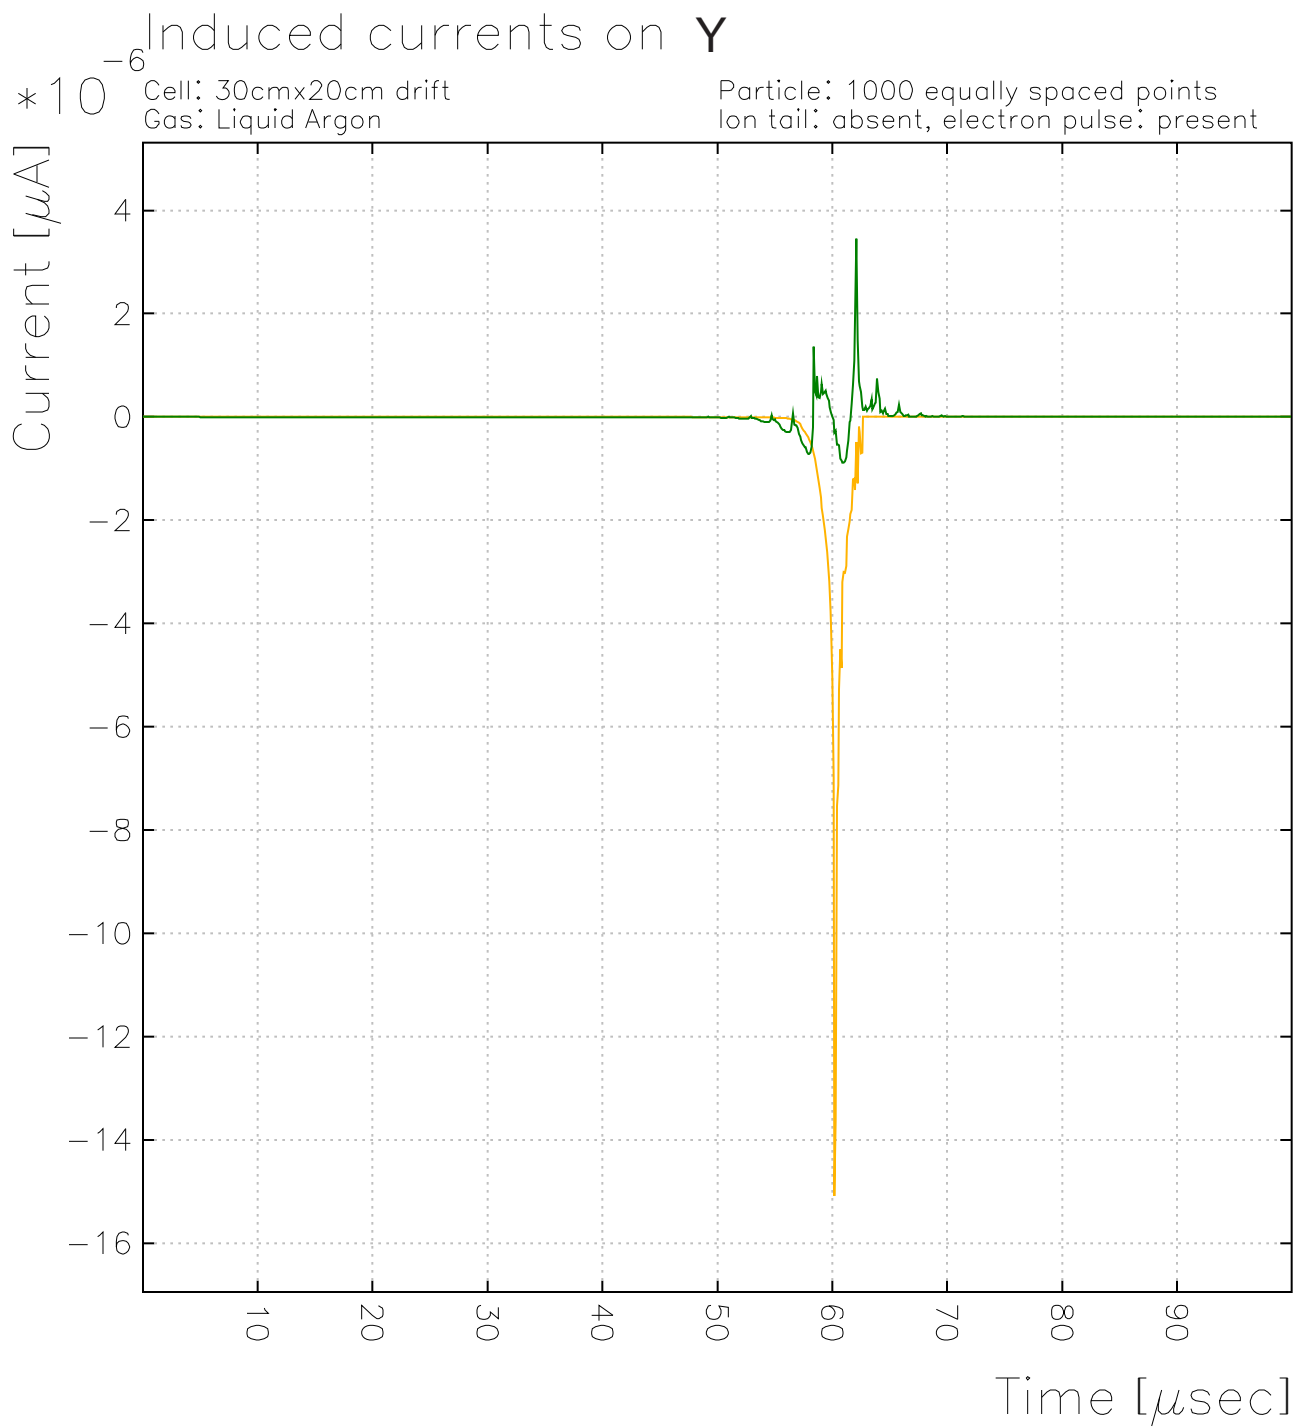

\* 10<sup>-6</sup>

Cell: 30cmx20cm drift  
Gas: Liquid Argon

Particle: 1000 equally spaced points  
Ion tail: absent, electron pulse: present

# Electron drift lines from a track

Cell: 30cmx20cm drift  
Gas: Liquid Argon

Particle: 1000 equally spaced points

5 degree from vertical

x-Axis [cm]

# Induced currents on U

\* 10<sup>-6</sup>

Cell: 30cmx20cm drift  
Gas: Liquid Argon

Particle: 1000 equally spaced points  
Ion tail: absent, electron pulse: present

# Induced currents on V

\* 10<sup>-6</sup>

Cell: 30cmx20cm drift  
Gas: Liquid Argon

Particle: 1000 equally spaced points  
Ion tail: absent, electron pulse: present

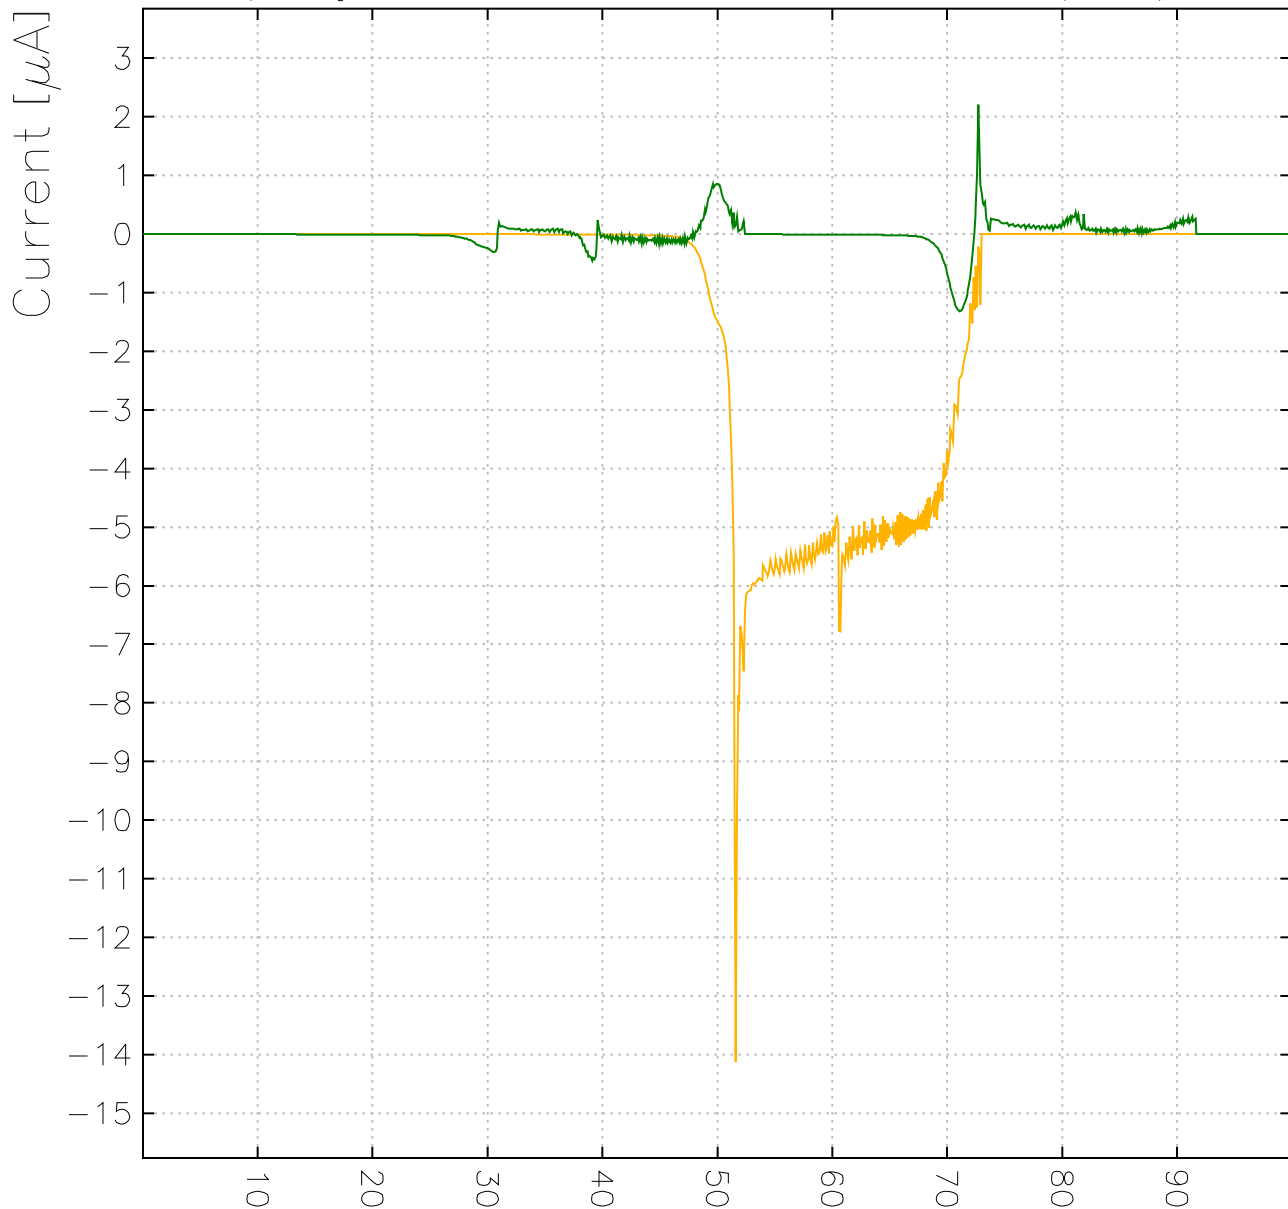

# Induced currents on Y

$\times 10^{-6}$

Cell: 30cmx20cm drift  
Gas: Liquid Argon

Particle: 1000 equally spaced points  
Ion tail: absent, electron pulse: present

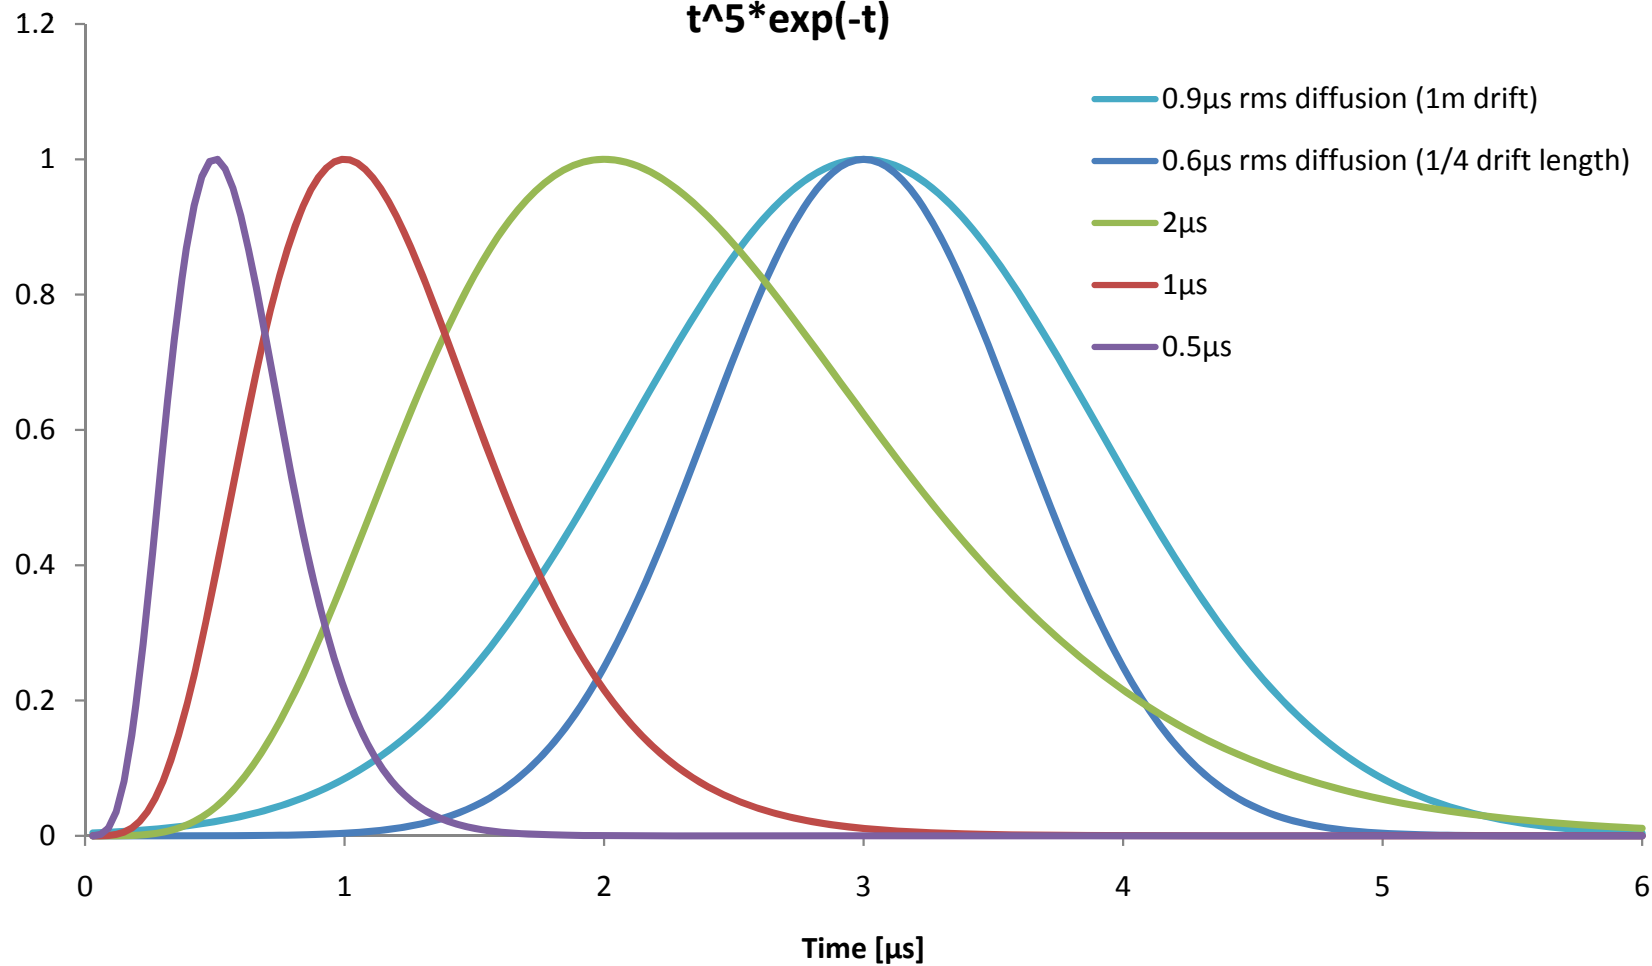

Time [ $\mu\text{sec}$ ]

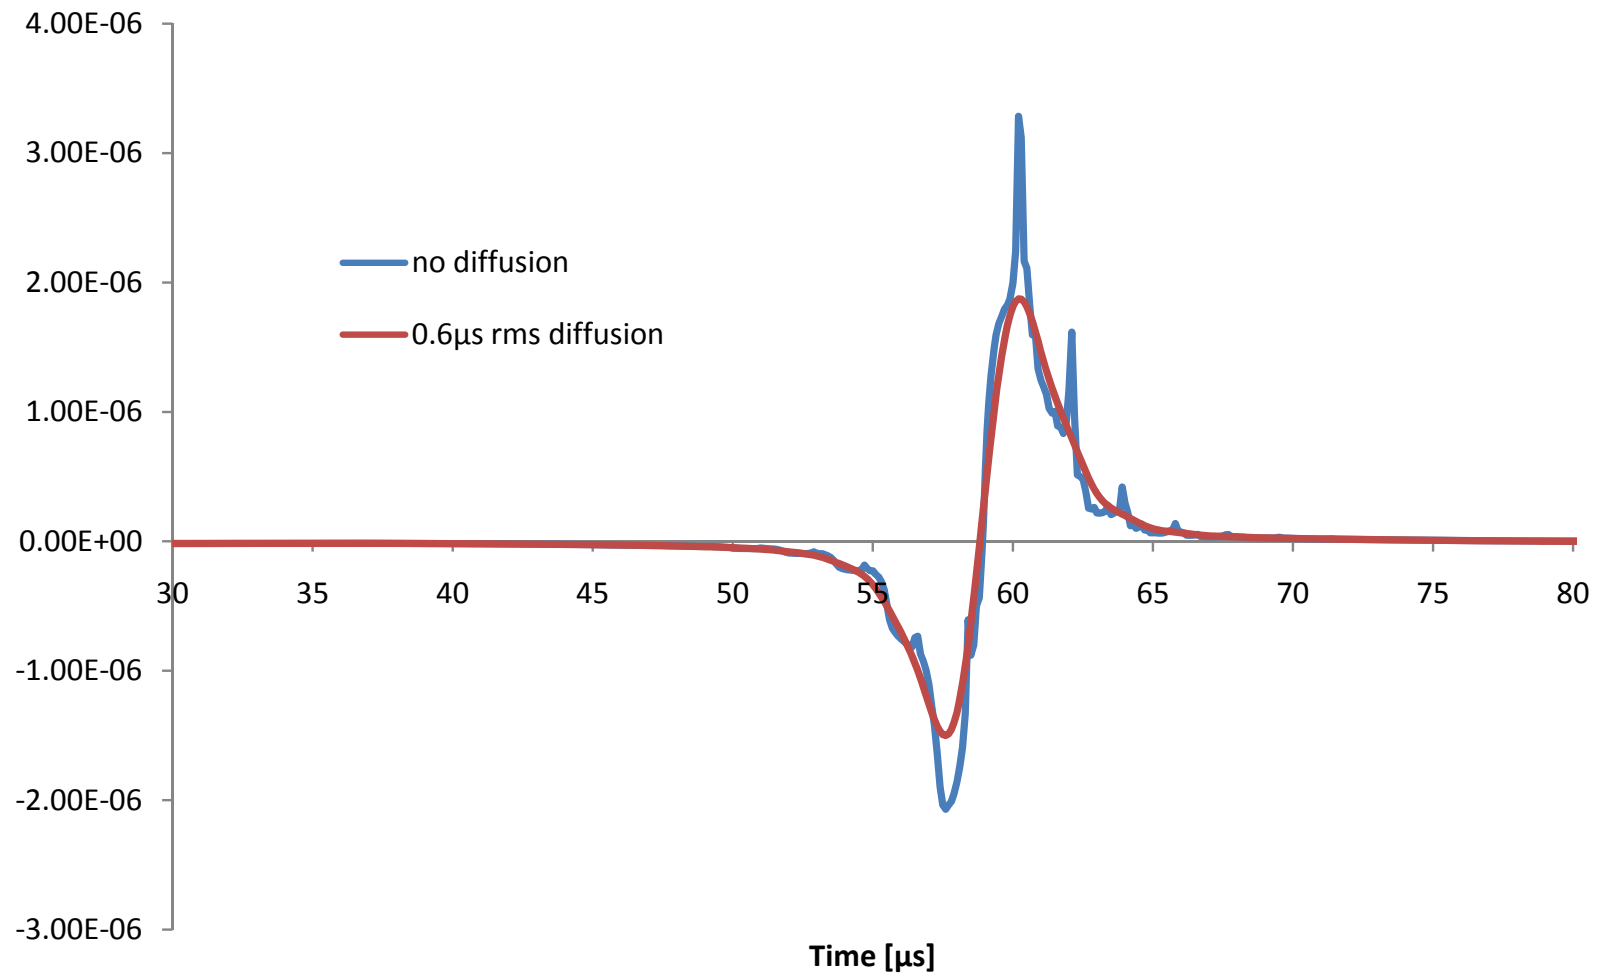

# Impulse Response Functions

$$t^5 \exp(-t)$$

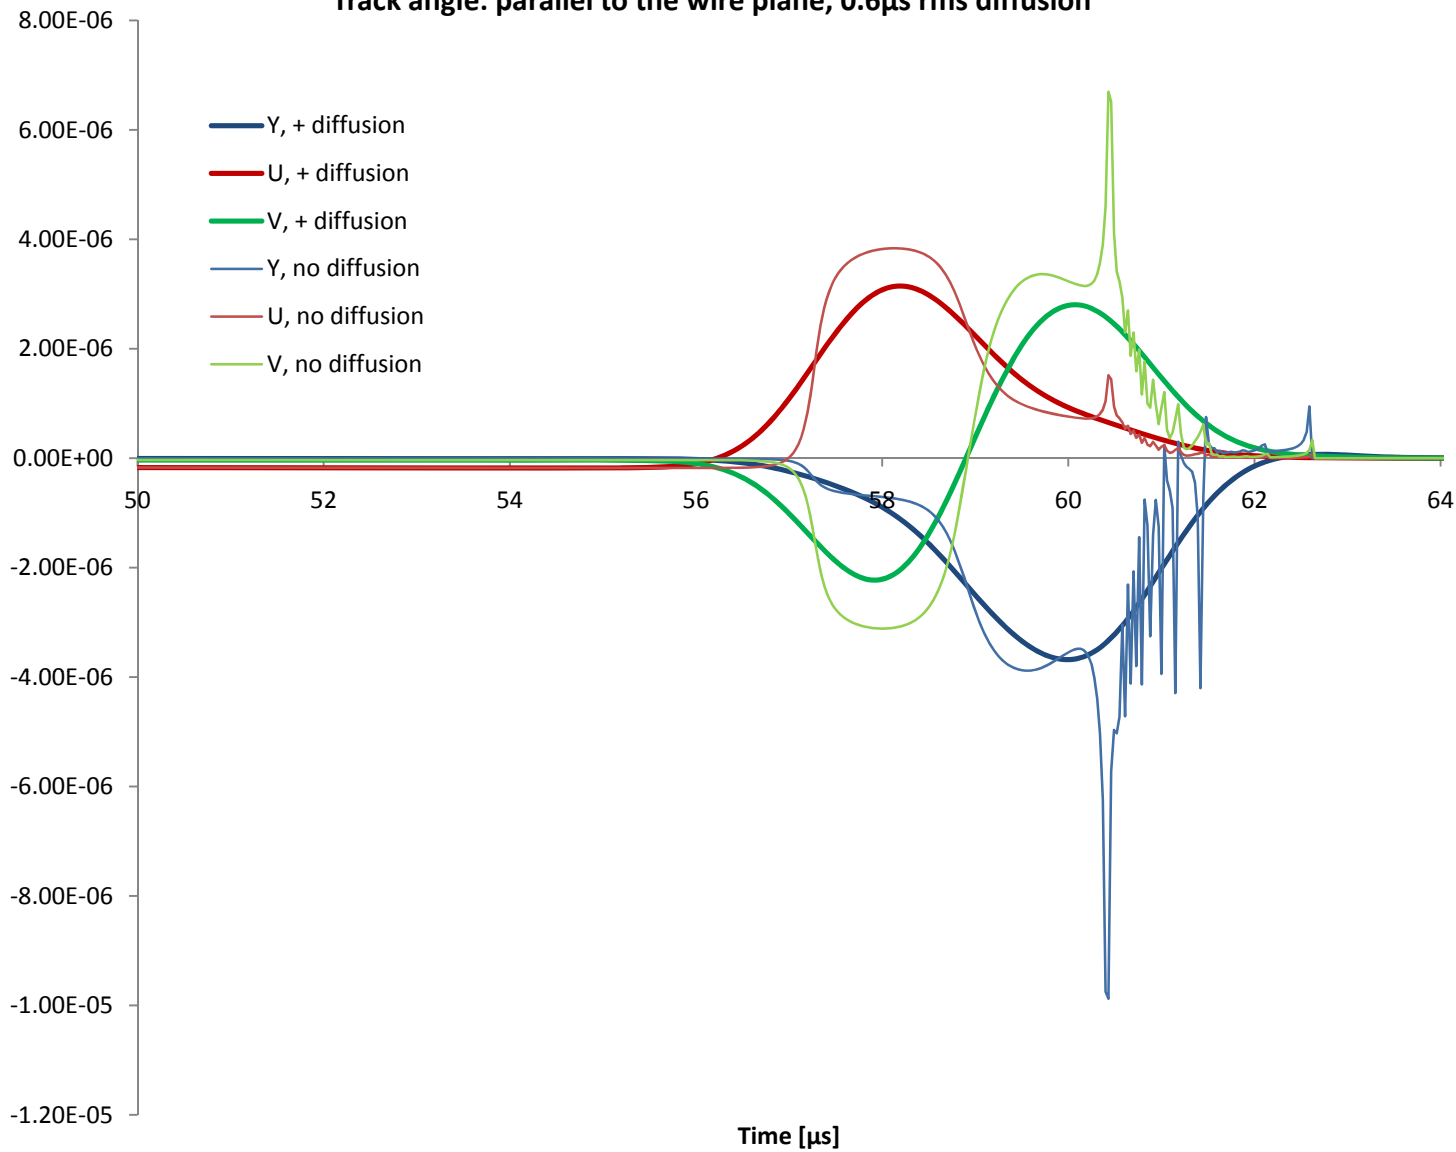

## Induced Current on a V Wire, 45 degree track angle

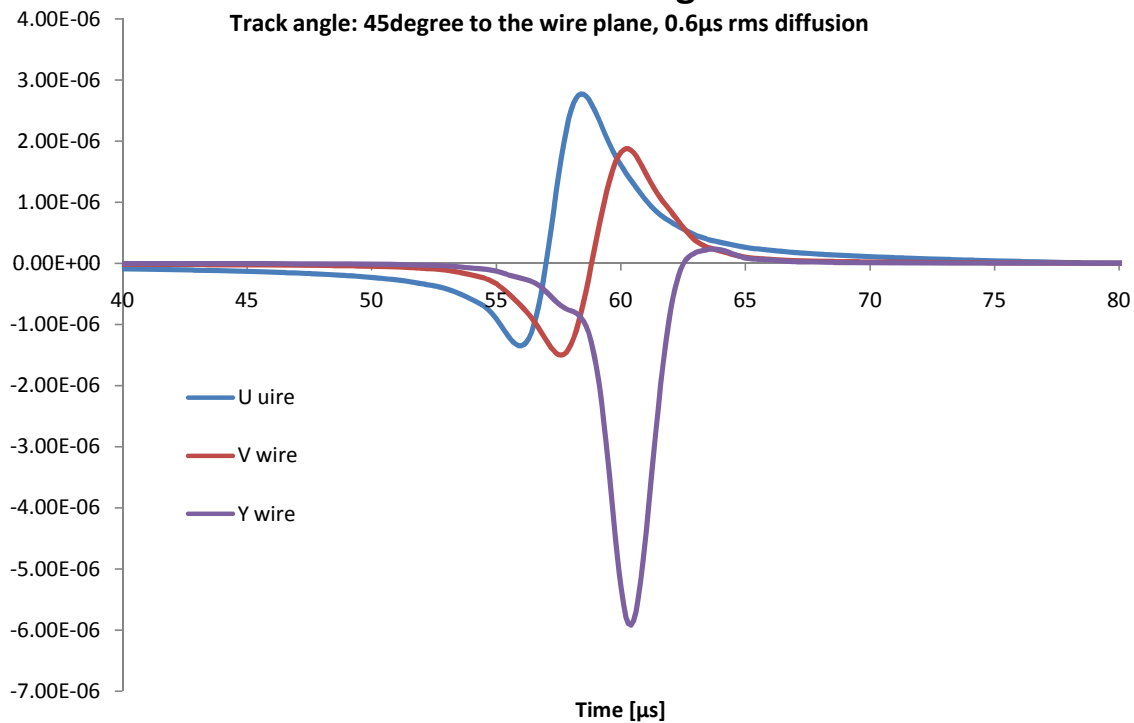

# Relative Pulse Height

Track angle: parallel to the wire plane,  $0.6\mu\text{s}$  rms diffusion

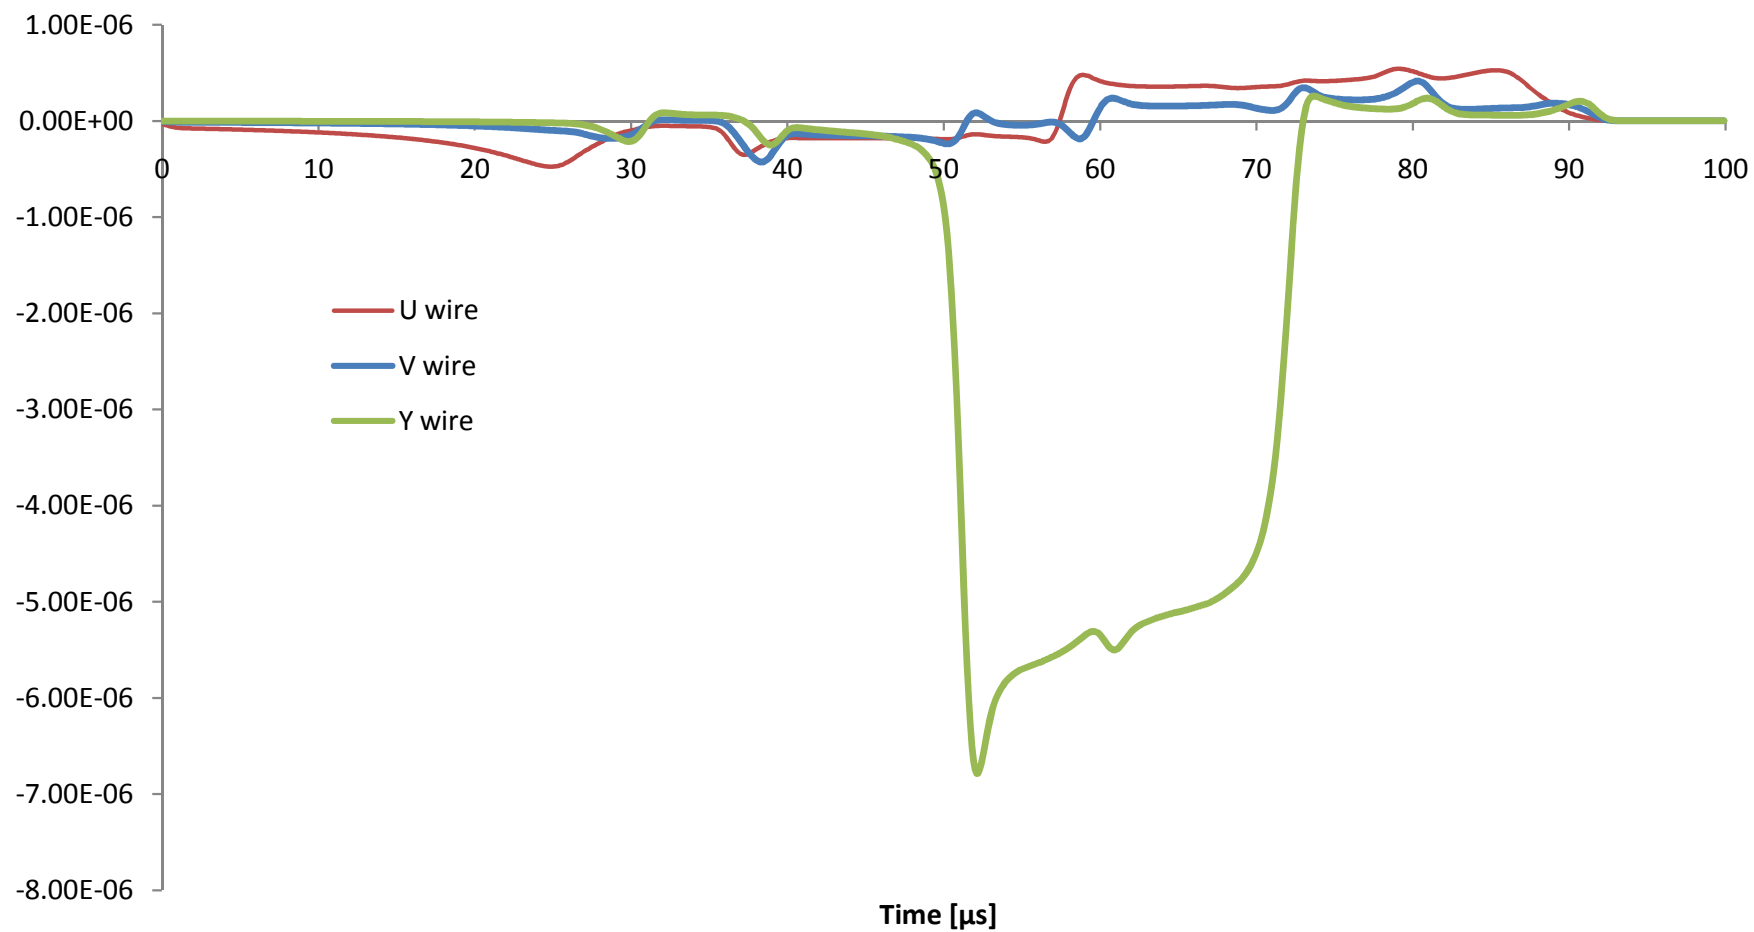

## Relative Pulse Height

Track angle: 45degree to the wire plane, 0.6 $\mu$ s rms diffusion

# Relative Pulse Height

Track angle: 5 degree from normal, 0.6 $\mu$ s rms diffusion

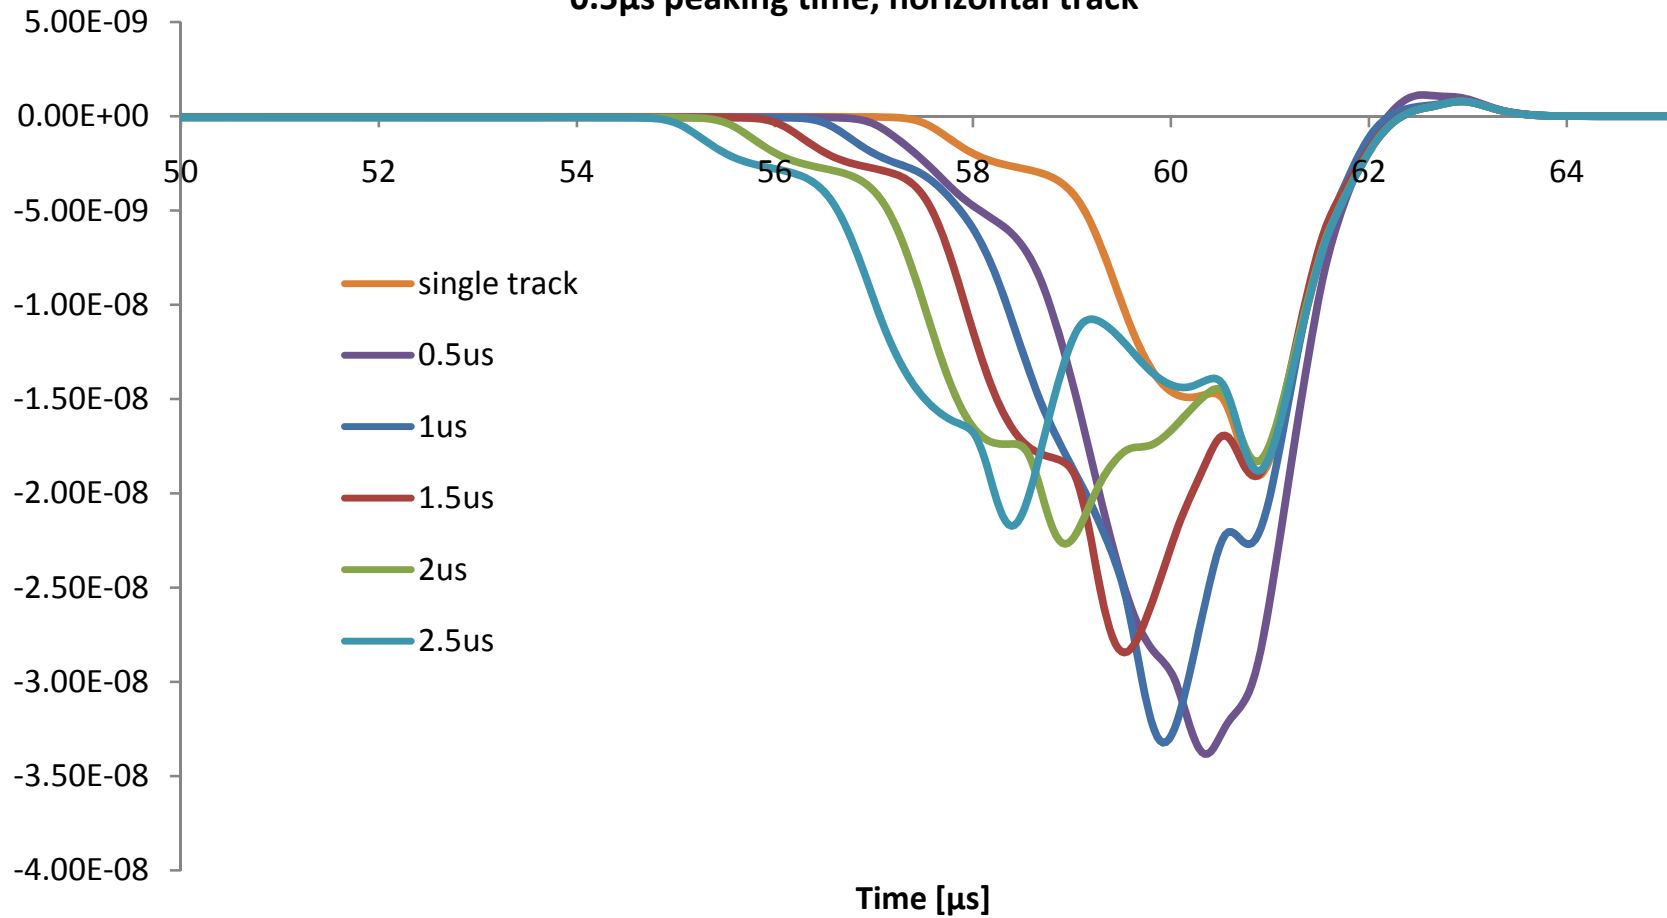

# Simulated Double Track Waveform

- The current waveform of two horizontal track segments are added together with an offset in time to simulate two tracks with a drift time delay between them.
- The summed waveform is convolved with a 5<sup>th</sup> order CR-RC impulse response with different peaking time.
- The drift velocity at 500V/cm in LAr is 1.6mm/ $\mu$ s.
- Contribution from diffusion (equivalent to about 1 $\mu$ s peaking time shaping) is NOT included in these plots.

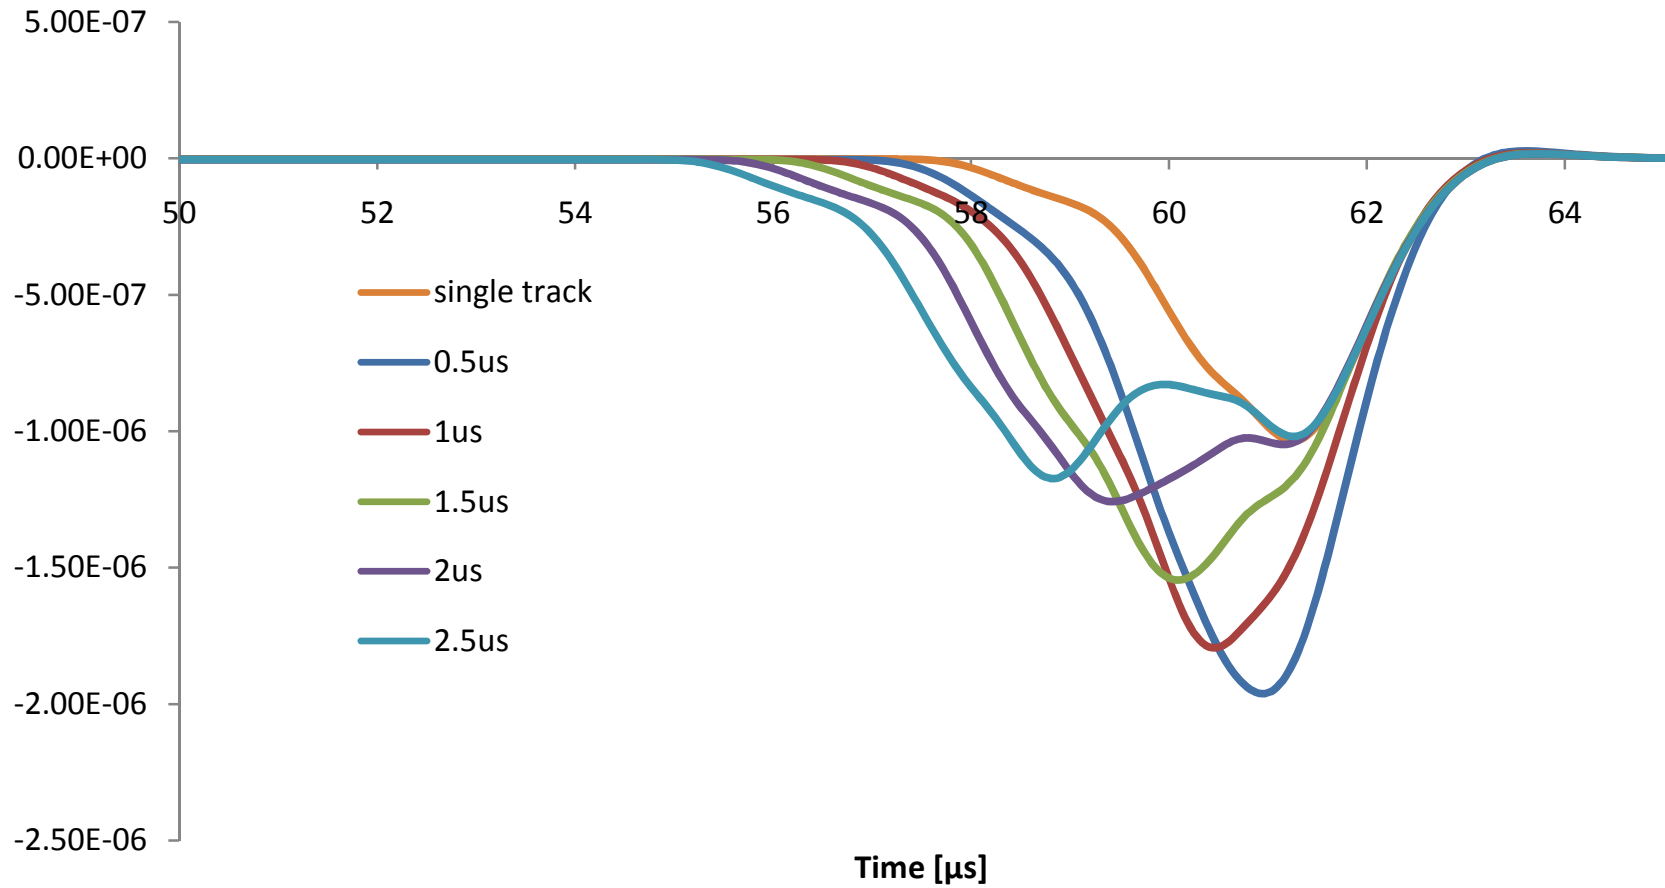

# Double Track Waveforms

0.5 $\mu$ s peaking time, horizontal track

# Double Track Waveforms

1 $\mu$ s peaking time, horizontal track

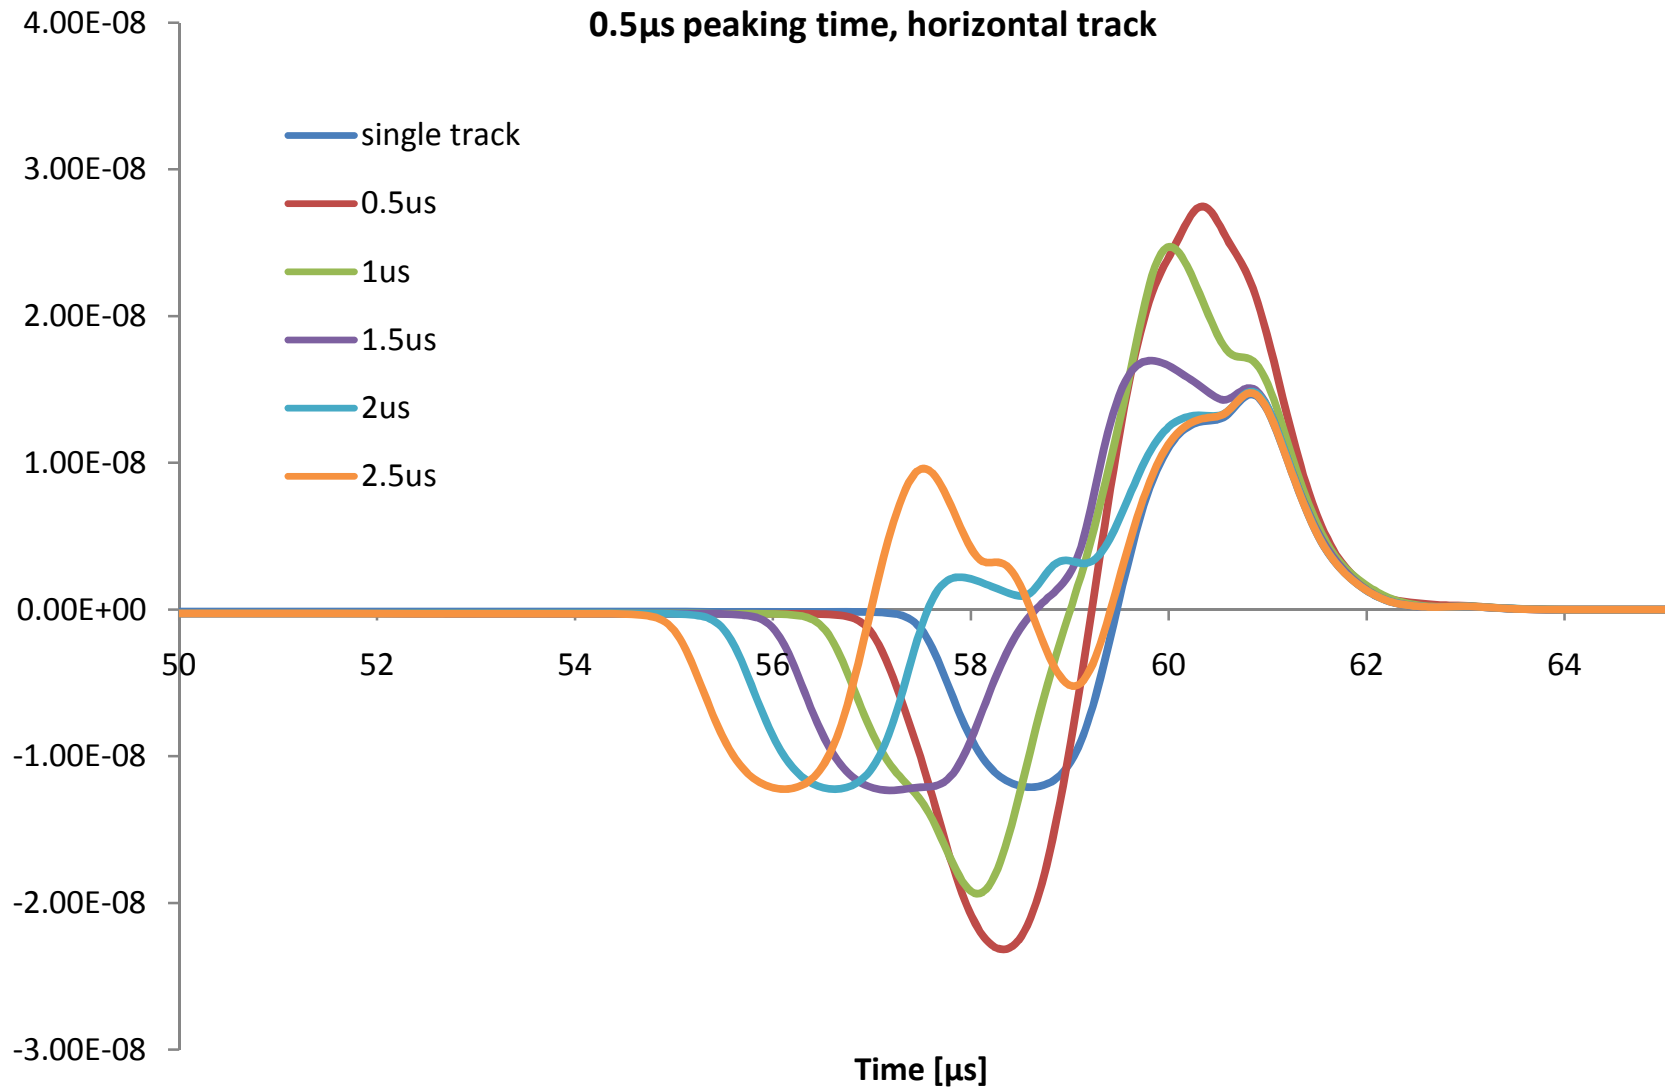

**2μs peaking time, horizontal trac**

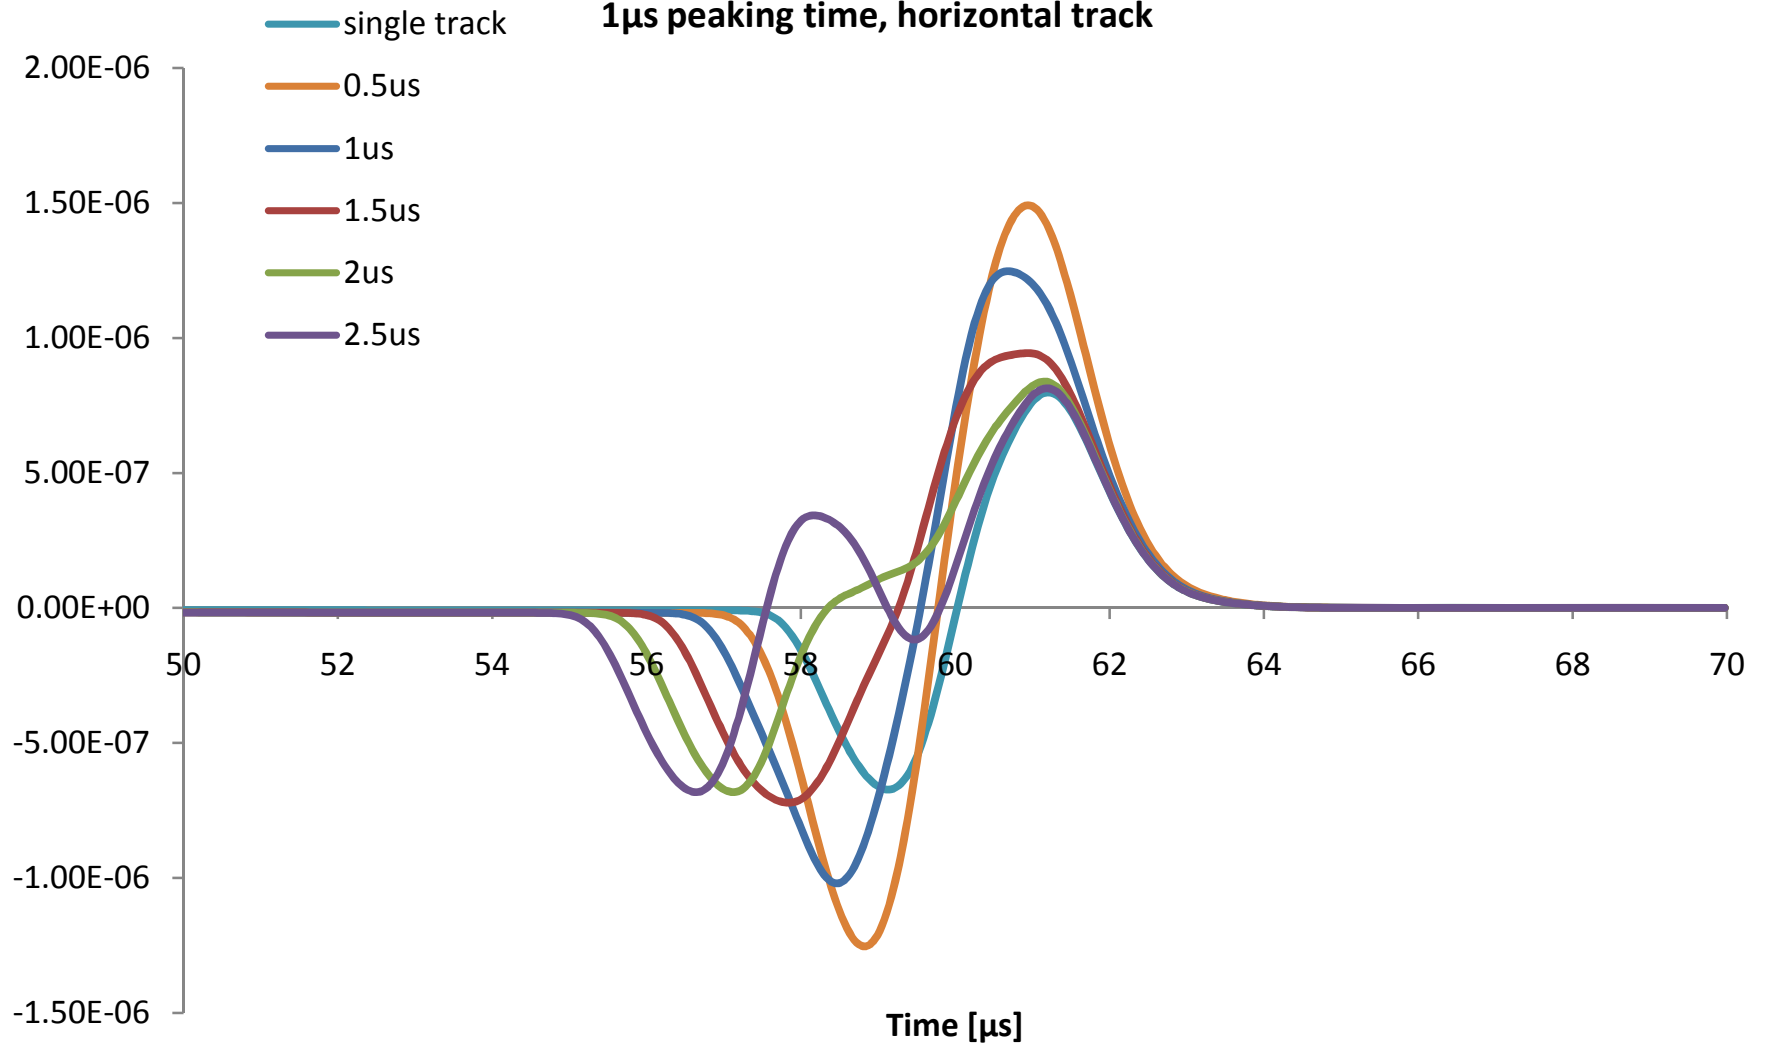

# Double Track Waveforms

0.5 $\mu$ s peaking time, horizontal track

**1 $\mu$ s peaking time, horizontal track**

## 2μs peaking time, horizontal track
